

KRYPTONITE

RAM HD BALL JOINT
INSTALLATION

LOWER BALL JOINT INITIAL - 35 lb·ft

UPPER BALL JOINT - 75 lb·ft

LOWER BALL JOINT FINAL - 150 lb·ft

These ball joints will need to go through a break-in period. Simulated memory steering is normal ranging from 50-500 miles depending on vehicle setup and terrain. You will notice more exposed stud on the upper ball joints due to a pressed in seal rather than a boot. Recommended grease EP2 NLGI 2

When installing the lower ball joint:

Orient the grease fitting toward the front of the axle. A slight angle ($\sim 45^\circ$) toward the engine will allow for easy access to grease fitting on the ball joint. (Ex 1)

The upper ball joint: will look as though it has a large gap, this is normal. (Ex 2)
